Bedside Rail

Thank you for choosing DASCO to provide you with your bedside rail. A side rail is a safety device to prevent the patient from rolling out of bed. It should not be used as a restraint. Caregivers must be sensitive to the patient's personal needs and safety at all times when using side rails. There will be a gap between the side rail and the mattress when the head spring is elevated.

OPERATING INSTRUCTIONS ...

The rails are lowered by pulling out on the pull buttons or plungers. Care should be exercised not to catch the patient's hands or feet in the rails as they are lowered. It is wise to hold the rail with one hand, while releasing the pull button with the other. This way it can be lowered slowly and in a controlled manner.

To raise the rail, lift up in the center until the plungers snap into the holes in the rail. Visually check to confirm that the plungers are securely seated.

When assisting a patient to turn onto his/her side, the rails should be in the up and locked position. The caregiver should stand on the side toward which the patient is to be turned – then reach over the rail and pull to provide the needed assistance. Providing this assistance can be made much easier by first adjusting the bed to a convenient height.

THANK YOU FOR CHOOSING DASCO HOME MEDICAL EQUIPMENT.
